# CONTENTS

Preface	xi
About the Author	xv
<b>CHAPTER 1</b>	<b>Introduction</b>
	<b>1</b>
Health	1
Epidemiology	4
Transmission of Disease	9
Descriptive Epidemiology	10
Analytic Epidemiology	13
Study Designs	14
Scientific Method	15
Biostatistics	16
Evaluating the Literature	17
Exercises	19
References	20
<b>CHAPTER 2</b>	<b>Data and Descriptive Measures</b>
	<b>25</b>
Data and Related Concepts	25
Populations, Samples, and Random Sampling	27
Scales of Measurement	28
Summarizing and Presenting Nominal and Ordinal Data	28
Summarizing and Presenting Numerical Data	41
Exercises	50
References	54
<b>CHAPTER 3</b>	<b>Standardizing Rates</b>
	<b>57</b>
Age-Specific Rates	58
Direct Method of Standardization	58
Indirect Method of Standardization	61
Uses of Standardized Rates	62
Exercises	66
References	67

<b>CHAPTER 4</b>	<b>Describing Data with Graphs</b>	<b>69</b>
	Arithmetic-Scale and Logarithmic-Scale Line Graphs	71
	Bar Chart	73
	Pie Chart	75
	Histogram	76
	Frequency Polygon	79
	Area Map	80
	Spot Map	81
	Stem-and-Leaf Plot	82
	Box Plot	85
	Scatter Plot	87
	Population Pyramid	87
	Exercises	90
	References	95
<b>CHAPTER 5</b>	<b>Life Tables*</b>	<b>97</b>
	Calculation of the Probability of Dying ( $q_x$ )	98
	Calculation of the Remaining Life Table	98
	Abridging the Complete Life Table	100
	Multiple Cause Life Table	104
	Years of Potential Life Lost	108
	Exercises	115
	References	117
<b>CHAPTER 6</b>	<b>Probability</b>	<b>119</b>
	Probability Concepts	119
	Mutually Exclusive Events versus Independent Events	122
	Conditional Probabilities	122
	Rule for Multiplying Probabilities	123
	Independent Events	123
	Bayes' Theorem	126
	Clinical Epidemiology	129
	Methods of Sampling	130
	Exercises	133
	References	135
<b>CHAPTER 7</b>	<b>Random Variables and Probability Distributions</b>	<b>137</b>
	Random Variables	137
	Probability Distributions for Discrete Random Variables	138

	The Binomial Probability Distribution	139
	The Poisson Probability Distribution	141
	Probability Distributions for Continuous Random Variables	142
	Normal Probability Distribution	142
	Normal Approximation to the Binomial	144
	Sampling Distribution	148
	Sampling Distribution of the Mean	148
	The Central Limit Theorem	149
	Exercises	151
	References	154
<b>CHAPTER 8</b>	<b>Estimation and Hypothesis Testing</b>	<b>155</b>
	Estimators	155
	Confidence Intervals for Normal Means and Known Variance	155
	$t$ Distribution	156
	Confidence Intervals for Normal Means and Unknown Variance	157
	Confidence Intervals for the Binomial with Large Sample Sizes	158
	Hypothesis Testing	159
	The $P$ Value	160
	Type I and Type II Errors	160
	Research Question about the Mean in One Group	161
	Research Question about a Proportion in One Group	164
	Research Question about Means in Two Separate Groups	169
	Research Question about Proportions in Two Independent Groups	172
	Evaluating Differences Using Error Bar Graphs	174
	Chi-Square Distribution	176
	Research Question about Means in Three or More Groups	178
	Exercises	182
	References	185
<b>CHAPTER 9</b>	<b>Sample Size</b>	<b>187</b>
	Sample Size Techniques for Analytic Studies	187
	Loss to Follow-Up	191
	Fixed Sample Size	192
	Ways to Minimize Sample Size and Maximize Power	193
	Sample Size Techniques for Descriptive Studies	194

	Exercises	198
	References	199
<b>CHAPTER 10</b>	<b>Study Designs</b>	<b>201</b>
	Study Design	201
	Cross-Sectional Study Design	204
	Ecologic Study Design	204
	Case-Control Study Design	205
	Cohort Study Design	207
	Nested Case-Control Study Design	209
	Chance, Bias, and Confounding	209
	Chance	209
	Bias	211
	Confounding	214
	Exercises	215
	References	217
<b>CHAPTER 11</b>	<b>Statistical Measures of Association Among Variables</b>	<b>219</b>
	Classification of Statistical Techniques and Tests by Variable Type	219
	Measures of Association for Two-Level Nominal Exposure and Outcome Variables	233
	Case-Control Study	234
	Cohort Study	234
	Cross-Sectional Study	235
	A Note on the Risk and Odds Ratios	244
	Some Cohort-Based Measures	244
	Sample Size Estimation for the Correlation Coefficient	248
	Exercises	250
	References	256
<b>CHAPTER 12</b>	<b>Experimental Studies</b>	<b>259</b>
	Experimental Study Designs	259
	Random Assignment	260
	Nonrandom Assignment	262
	Blinding	263
	Designing a Clinical Trial	265
	Other Selected Types of Experimental Studies	269

	Exercises	272
	References	273
<b>CHAPTER 13</b>	<b>Survival Analysis*</b>	<b>275</b>
	The Life Table Method	276
	The Product Limit Method	283
	Log-Rank Test	287
	Exercises	292
	References	296
<b>CHAPTER 14</b>	<b>Cause and Effect</b>	<b>297</b>
	Causal Inference	297
	Causal Models	302
	Modes of Disease Transmission	303
	Risk Factors	305
	Web of Causation	306
	Exercises	310
	References	312
	Appendix A: SAS Procedure Code	313
	Appendix B: Tables	325
	Appendix C: Model Building	353
	Appendix D: Answers to Chapter Exercises	357
	Index	411

\*Chapters 5 and 13 are more statistically rigorous and may be considered optional in a beginning class. Skipping these chapters does not interfere with the flow of the book.

## PREFACE

*Fundamentals of Epidemiology and Biostatistics: Combining the Basics* is an introductory text for students in epidemiology, clinical medicine, health policy and management, nursing, and various allied health fields. Students and professionals in all these settings should have knowledge of the basic principles of epidemiology and biostatistics. There are many subfields of public health and medical research, but epidemiology and biostatistics are fundamental to all these areas of study.

This book is intended to be used in a single course offered during a block or semester. Its primary purpose is to present the distinct and complementary roles of epidemiology and biostatistics to public health and clinical medicine in the context of substantive, interesting, and current applications. *Fundamentals of Epidemiology and Biostatistics: Combining the Basics* presents the material in a clear, concise, and accurate manner. Readers of this book will gain an appreciation of the fact that identifying, understanding, and solving public and clinical health problems often require thinking in terms of principles and practices in the areas of epidemiology and biostatistics.

Some of the special features of this book include the following:

**Topics:** This text includes fundamental concepts and methods that are required for a basic understanding and interpretation of epidemiology and biostatistics for public health and clinical medicine. The outline follows a logical sequence.

**Substantive examples:** Practical and relevant public health and clinical examples are used in each chapter.

**Actual data:** Many of the examples presented are based on actual data involving health-related states or events.

**Assignment problems:** Each chapter has a set of questions to determine students' mastery of the material.

**Graphical excellence:** Introductory statistical graphics that can be produced with spreadsheet or charting software are presented in order to effectively present data.

**Computer applications:** Computer applications using SAS are used to demonstrate data analysis throughout the book; procedure code is provided in Appendix A.

**Statistical inference:** Concepts of sampling, hypothesis testing,  $P$  values, and confidence intervals are presented.

**Causal inference:** Ways to support conclusions about cause-and-effect relationships are presented.

**Structure:** The book sets off definitions, historical information, and certain formulas in boxes, and key words are in italic type in order to enhance readability and strengthen prominent points.

This book has four major biostatistics themes: descriptive statistical procedures (Chapters 2–5), probability (Chapters 6 and 7), statistical inference (Chapter 8), and statistical techniques for determining appropriate sample size and assessing data (Chapters 9, 11, and 13).

In the chapters covering descriptive statistics, we define terms important in the application of epidemiology and biostatistics, present scales of measurement and ways to summarize and present nominal and ordinal data, describe two methods to standardize rates, introduce life tables, present the method for calculating years of potential life lost, and describe standard ways to summarize and present numerical data. We also introduce statistical notation and present several types of graphs that are useful for describing the distribution of health-related states and events.

In the two chapters covering probability, we introduce probability concepts, probability distributions, probability distribution for sample statistics (called sampling distributions), Bayes' Theorem, and selected sampling methods. Statistical inference is introduced in a single chapter that addresses methods for estimating population parameters and how to examine and test hypotheses. Finally, the statistical techniques part of the book includes various methods for calculating sample size for different types of research questions and selected approaches for analyzing research questions about relationships among variables and about patient survival across time.

These four major biostatistics themes play a fundamental role in conducting observational and experimental epidemiologic studies, which investigate the distribution and determinants of health-related states or events in human populations. The primary purpose of this study is to prevent and control health problems. The study design is central to epidemiology. Several study designs employed in epidemiology are introduced and described, along with the quantitative elements of these designs. Chapter 1 provides a description of the distinct yet complementary roles of epidemiology and biostatistics in public health and clinical medicine and the basic study designs used in epidemiologic research. Chapter 10 focuses on selected observational study designs, while Chapter 12 focuses on experimental study designs. Finally, because drawing conclusions about causality is critical in epidemiology for developing appropriate disease and health-related prevention and control measures, this topic concludes the book (Chapter 14). Criteria for establishing cause-and-effect relationships are discussed, and selected causal models are presented.

After completing this book, the student should be able to:

- Describe the distinct but complementary roles of epidemiology and biostatistics in public health and clinical medicine.
- Apply descriptive epidemiology and biostatistics procedures to understand and describe the distribution of health-related states or events.
- Apply probability concepts and probability distribution theory to understanding and describing health problems, identifying the efficacy of medical screening and testing procedures, and sampling in order to obtain a representative group of study participants.
- Derive estimators from a sample that is used to estimate an unknown population parameter and measure the precision in the estimators using confidence intervals.
- Apply the steps of hypothesis testing to answer research questions about means and proportions in single groups, in two independent groups in one group, in two dependent groups, in more than two independent groups, or in more than two dependent groups.
- Determine appropriate sample size and assess various types of research questions.
- Identify and apply appropriate observational or experimental study designs to answer specific public health or medical research questions.
- Estimate survival curves using the life table (actuarial) method or the product-limit (Kaplan-Meier) method and evaluate statistical significance of differences between curves using the log-rank test.
- Apply causal theory and causal criteria to identify determinants of health-related states or events.
- Apply the study of the distribution and determinants of health-related states or events to prevent and control health problems.
- Apply SAS in studying the distributions and determinants of health-related states or events in human populations.

## ABOUT THE AUTHOR

Ray M. Merrill, PhD, MPH, MS, is a professor of epidemiology and biostatistics at Brigham Young University. He is also an adjunct professor in the Department of Family and Preventive Medicine and the Department of Health Promotion and Education at the University of Utah. He is a former cancer prevention fellow at the U.S. National Cancer Institute and a visiting scientist in the Unit of Epidemiology for Cancer Prevention at the International Agency for Research on Cancer, Lyon, France. He has won several awards for his research in epidemiology and is currently a fellow of the American College of Epidemiology and of the American Academy of Health Behavior. He teaches classes in epidemiology and biostatistics and is the author of over 200 peer-reviewed publications and 5 books.
